

Introduction to Gradle

Who am I?

Donát Csikós
Software Engineer
Gradle Inc.

Java development & tooling

Table of Contents

- Introduction
- Core features
- IDE support
- Gradle Cloud Services

Introduction

The Gradle Build Tool

“The Gradle Build Tool is a modern open source polyglot build automation system”

- Like Maven, but...
- No restrictions, only conventions
- Enabler for continuous delivery

Success stories

NETFLIX

Prezi

Gradle core features

Build definition

- `build.gradle` script
 - Groovy language + Gradle DSL
- Resources
 - User guide
 - DSL reference

Task definition

```
task sayHello() << {  
    println "Hello, World!"  
}
```

- Task = single unit of work
- Backed by an [org.gradle.api.Project](#) instance
- << is shorthand for the [Task.doLast\(Closure\)](#) method

Built-in tasks

```
Terminal
$ gradle tasks
:tasks
[
-----
All tasks runnable from root project
-----
[
Build Setup tasks
-----
init - Initializes a new Gradle build. [incubating]
wrapper - Generates Gradle wrapper files. [incubating]

Help tasks
-----
buildEnvironment - Displays all buildscript dependencies declared in root project 'emptyproject'.
components - Displays the components produced by root project 'emptyproject'. [incubating]
dependencies - Displays all dependencies declared in root project 'emptyproject'.
dependencyInsight - Displays the insight into a specific dependency in root project 'emptyproject'.
help - Displays a help message.
model - Displays the configuration model of root project 'emptyproject'. [incubating]
projects - Displays the sub-projects of root project 'emptyproject'.
properties - Displays the properties of root project 'emptyproject'.
tasks - Displays the tasks runnable from root project 'emptyproject'.

To see all tasks and more detail, run gradle tasks --all

To see more detail about a task, run gradle help --task <task>

BUILD SUCCESSFUL

Total time: 0.616 secs
$
```

Task properties

- Group and description: visual aid to organise tasks

```
task sayHello {  
  description "Prints out the text 'Hello, World!'"  
  group 'Incquery Academy'  
  
  doLast {  
    println 'Hello, World!'  
  }  
}
```

```
properties - Displays the properties of root project 'example-project'.  
tasks - Displays the tasks runnable from root project 'example-project'.
```

```
Incquery Academy tasks
```

```
-----
```

```
sayHello - Prints out the text 'Hello, World!'
```

Task properties

- Dependencies

```
task a << { println "Task A" }  
task b(dependsOn: a) << { println "Task B" }
```

Task types

- Each tasks have task types
- `DefaultTask` is used if not defined
- Built-in tasks: `Copy`, `Exec`, `Zip`, `Jar`, etc
 - Listed in the [DSL reference](#)
- Can implement a custom one

```
task copyDoc(type: Copy) {  
    from 'src/doc'  
    into 'build/doc'  
}
```

Inputs and Outputs

- Tasks can declare their input and output files and folders
- Task execution is skipped if task is 'up-to-date'
 - input same
 - output untouched

```
task copyDoc(type: Copy) {  
    from 'src/doc'  
    into 'build/doc'  
}
```

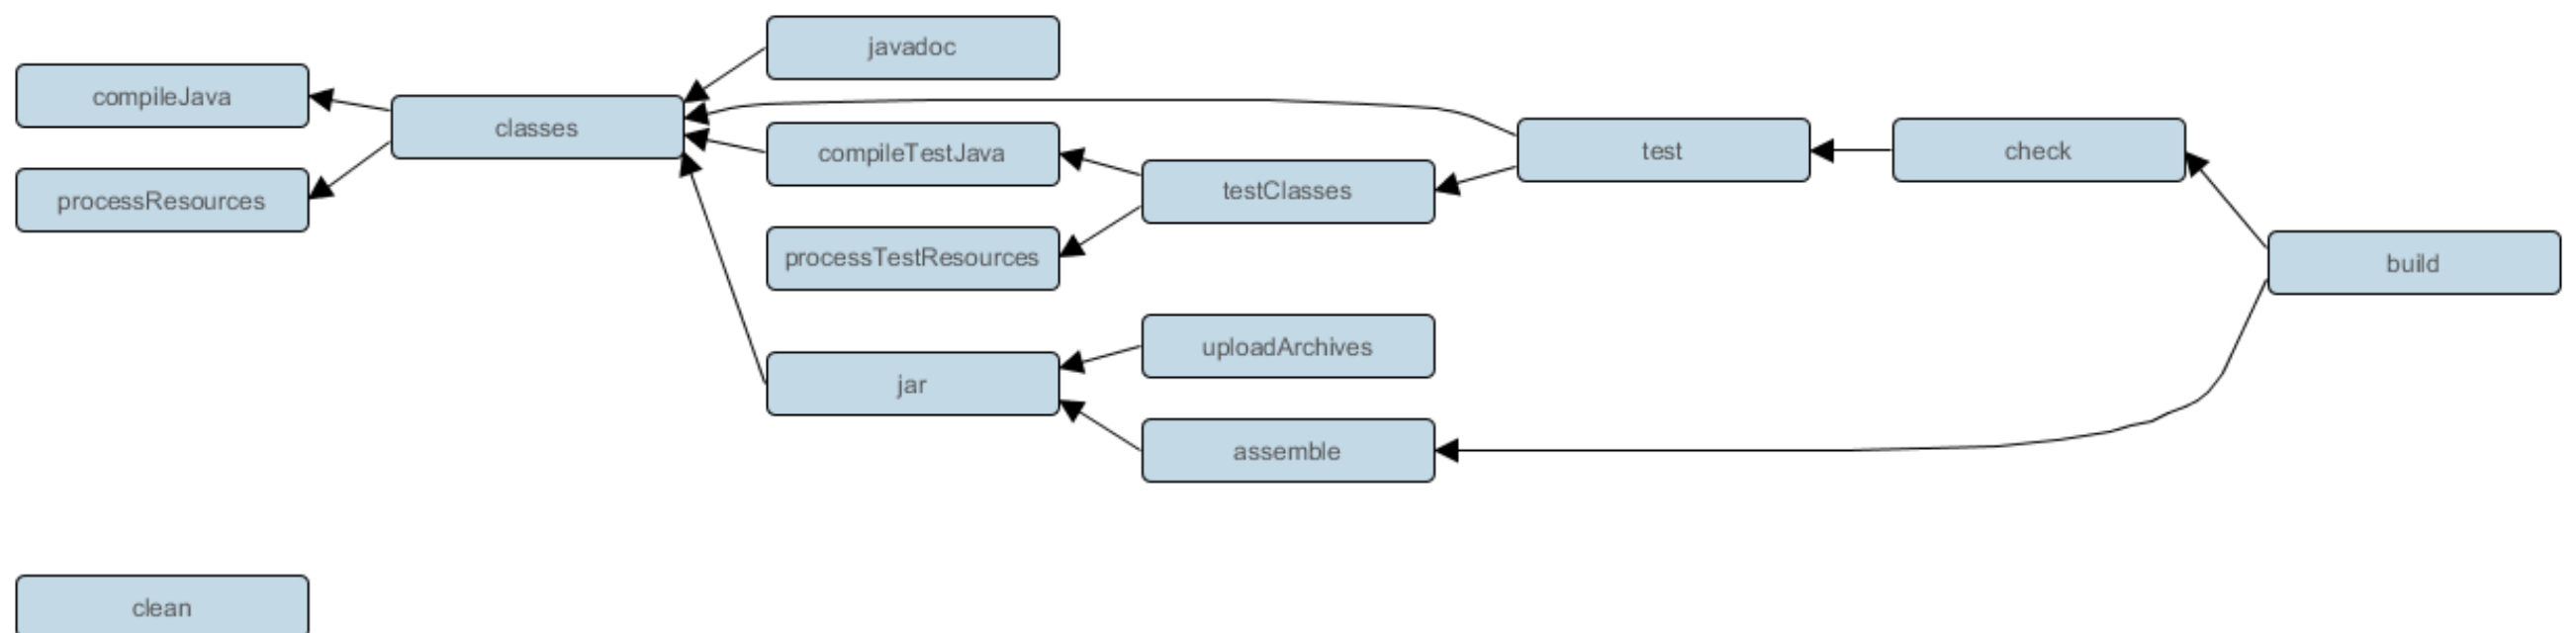

Plugins

- Plugins contribute tasks, domain objects, conventions and object extensions
- Gradle core functionality is already organised into plugins
- ~800 external plugins are available in the Gradle plugin portal

Java plugin

- apply plugin: 'java'
- compilation, testing, bundling
- basis for other plugins

Project customization

- Via DSL configuration, or
- Programmatically

Dependency management

- Transitive dependency management
- Support for non-managed dependencies
- Customisable dependency resolution
- Integration with existing dependency management infrastructure

Dependency management

- Repository definition

```
repositories {  
    flatDir name: 'libs', dirs: "$projectDir/libs"  
    maven { url 'https://repo.gradle.org/gradle/libs-releases' }  
    mavenCentral()  
}
```

Dependency management

- Defining dependencies

```
dependencies {  
    compile 'com.google.guava:guava:19.0'  
    testCompile "org.spockframework:spock-core:2.0-groovy-2.4"  
    runtime('org.hibernate:hibernate:3.0.5') {  
        transitive = false  
    }  
}
```

Dependency management

- Dependency substitution

```
configurations.all {  
    resolutionStrategy.eachDependency { DependencyResolveDetails details ->  
        if (details.requested.name == 'log4j') {  
            details.useTarget "org.slf4j:log4j-over-slf4j:1.7.10"  
        }  
    }  
}
```

Gradle wrapper

- A script to download and execute Gradle
- It can be checked into VCS along with the project
- Build users don't have to download the Gradle to compile the projects
- Upgrading Gradle is transparent to the build users

IDE integration

Buildship: Eclipse plugins for Gradle

- Developed by Gradle Inc.
 - My main focus :)
- Top-level Eclipse project
- Pre-installed in 3 packages since Eclipse 4.5
- Latest release 1.0.18
- Vision: single source of build logic

Buildship hands-on

- Project import
- Project synchronisation
- Tasks view
- Executions view
- Test execution

Gradle Cloud Services

Gradle Cloud Services

- Gradle Inc. has been purely a services company
- GCS introduced this year
 - Commercial products/services on top of Gradle
- First service: Build Scans
 - Shareable build insights
 - Free offering

Build scans

The screenshot shows a web browser window with the URL <https://scans.gradle.com/s/o7qdwg77k2qk4>. The page displays a Gradle Build Scan for a task named 'step7' (clean build). The scan was completed in 8.6 seconds. The user profile 'csdonat' is shown. The scan details include: Ran for 8 sec, Started today at 21:45:44 CEST, finished today at 21:45:52 CEST, Gradle 3.0-rc-1, and Build Scan Plugin 1.0. A link to 'See console output' is provided. The performance breakdown shows: Initialization and Configuration (7.062s) and Task Execution (1.560s). A link to 'See performance details' is also present. At the bottom, it states '1 test executed in 1 project taking 0.662s'.

Build Scan for 'step7' today at x

 **✓ step7** clean build 

Ran for 8 sec
Started today at 21:45:44 CEST, finished today at 21:45:52 CEST
Gradle 3.0-rc-1
Build Scan Plugin 1.0

csdonat

See console output

8.6 sec

Initialization and Configuration	7.062s
Task Execution	1.560s

See performance details

1 test executed in **1 project** taking 0.662s

Class: HelloTest, test

There's so much more

- Publishing artifacts
- Gradle Kotlin script
- Composite builds
- Gradle daemon
- Plugin authoring
- Java 9 support
- Build script testing
- Multi-project builds
- Native builds
- Framework x support
- Task cache
- Continuous build
